for name git repo i changes name of repo and deleted all branches

except dev

so give me new instruction based on old

Here's your **updated Git workflow and instructions** for your newly renamed repo, given that you've **deleted all personal branches except for** `dev`.
You can share this updated guide with your team for a smooth start!

AttendSmart Git Workflow — Clean Start Edition

Branch Strategy

- **main**: Protected, stable, milestone releases ONLY (create later, if not present now)
- **dev**: The only base branch now; all work happens from here through feature/task branches
- **feature/task branches**: Create a new branch from `dev` for each feature, bugfix, or documentation task

Team Step-by-Step Workflow

1. Clone the Repository (First Time Only)

```
git clone https://github.com/[your-org-or-username]/AttendSmart.git
cd AttendSmart
```

2. Keep Your Local Code Up to Date

```
git checkout dev
git pull origin dev
```

Do this before you start any new work.

3. Create a Branch for Each Feature or Task

- Name your branch by feature/task + your name, for example:
  - `feature/qr-scan-nuhan`
  - `bugfix/login-auth-krish`
  - `doc/architecture-readme-yashas`
  - `feature/badge-ui-rakshitha`

```
git checkout -b feature/<short-description>-<yourname>
```

4. Do Your Work in the New Branch

- Make changes, add/test code
- Add and commit frequently with clear messages:

```
git add .
git commit -m "feat: add QR attendance scan page"
```

5. Sync with dev if Others Are Pushing

If you spend several days on a feature, pull the latest `dev` and merge:

```
git pull origin dev
# Fix any conflicts, add/commit changes if needed
```

6. Push Your Branch to GitHub

```
git push origin feature/<short-description>-<yourname>
```

Replace the branch name with your actual branch name.

7. Open a Pull Request (PR)

- **Base branch:** `dev`
- **Compare branch:** your feature branch
- Add a description (what you built, Issues fixed, etc.)
- Request review from teammates

8. Address Review Feedback & Complete Your PR

- Make additional changes if reviewers request updates.
- Always use `git push` to update the same branch (your PR will update).

9. Merge Your Branch (When Approved & All Checks Pass)

- Only after review and checks are green, merge your PR into `dev`.
- **Delete your feature branch** after merging (keeps things clean).

10. Never Work Directly on `dev`

- All team members work ONLY in **feature/task branches**—not on `dev` directly.
- `main` is only updated via PR after all features are tested/stable on `dev`.

Golden Rules

- **Branch from `dev` every time.**
- **Pull latest `dev` before starting a branch.**
- **PRs target `dev`, not `main`.**
- **Delete merged branches regularly.**

Project Folder Quick Structure (Suggested)

```
AttendSmart/
  dev
  main   (protected, deployable)
  feature/qr-scan-nuhan
  bugfix/login-auth-krish
  doc/architecture-readme-yashas
  ...
```

Sample Workflow for a New Feature (e.g., QR Scan)

```
git checkout dev
git pull origin dev
git checkout -b feature/qr-scan-nuhan
# Make changes, develop code
git add .
git commit -m "feat: add QR attendance scanning"
git push origin feature/qr-scan-nuhan
# Open PR on GitHub to dev, request review
```

```
# Address feedback, merge after approval
# Delete local/remote feature branch after merge
```

Share this with your team to ensure consistency!
If you need this formatted as a PDF or want a sample PR template, just ask!
